Practice 4 - Branching and Pull Request

Deadline: Check onsite on or before week 5 lab.

Use the Teedy project you forked from sustech-cs304/Teedy last week.

You need to do the following:

- Clone **YOUR** Teedy repo to your local computer.
- Create a new branch named "b-yourid". Here "yourid" means your id. If your id is 11111111, then your branch is "b-11111111". Switch to the new branch.
- In this new branch, make a little modification to the software: add "visiting as guest" option. Looks like follows (See original demo if you need any hint):

- Commit your changes in this branch, then push this branch to your Github repo. Since the new branch is created locally, it don't exist in your remote repo. Refer to https://github.com/git-guides/git-push if you need to know how to do that.
- Make a pull request on your Github repo. Merge the new branch into the main branch. Then approve merge. Make sure the merge is successful.
- Show the changes you have made to us, like:

master ▾

Commits on Feb 22, 2023

Add "Login as guest" on Login page
Your name committed 6 minutes ago ●
